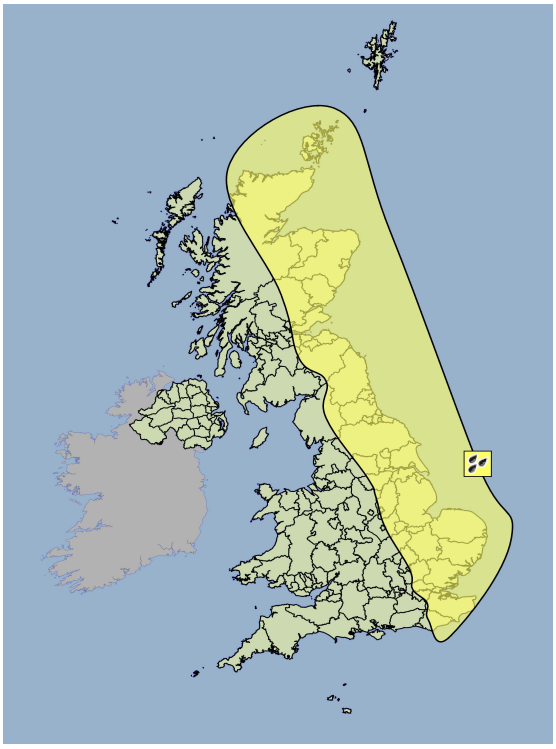
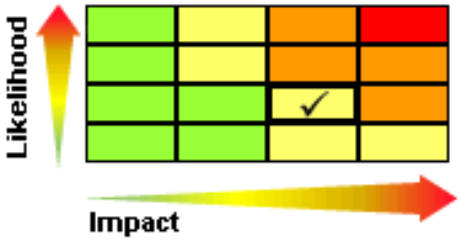
National Severe Weather Warning Service





Chief Forecasters Assessment
The remnants of the very warm, humid, unstable airmass are still affecting eastern and some central parts of the UK today. As a result, further thundery showers are likely to develop across these parts in response to daytime heating today. There remains some uncertainty regarding exactly where these may develop and, as often happens in this situation, some areas will stay dry. Meanwhile, a frontal zone will bring some more persistent and possibly thundery rain to parts of northeast Scotland.

The Met Office have issued a **Yellow Warning** of **Rain**

Valid from **11:20 on Sun, 20th Jul 2014** until **23:55 on Sun, 20th Jul 2014**

Further heavy, thundery showers are likely to develop in some eastern parts of the UK today. Although many places within the warning area will stay dry, where storms do occur, torrential downpours are possible with lightning, hail and perhaps locally strong wind gusts. The most likely areas for local disruption are across parts of eastern and southeastern England. Some more persistent, and at times, thundery rain, will affect parts of northeast Scotland.

The public should be aware of the risk of surface water flooding or localised flooding from fast-responding urban watercourses.

This is an update to the warning to extend it slightly further west across central and northern England and also to include Orkney.
